Charlotte,

This is the information I received from Kara King, the Fort Resolution Metis council president. The water treatment plans and tailings measurements. Snap Lake is connected to Artillery Lake Watershed so it will impact water levels for when we go for Caribou, also their waste piles are going to be 400 feet and have acidic run off. If the water levels fluctuate at Artillery Lake and its watershed it can impact our ability to harvest wildlife. Impacts to the fish are unknown to date. Also with the rock pile going to be as high up to 400 feet, what impacts is that going to have on caribou migrations.

The

Mashi,

Tim Heron
